

**Keep your home
free from
damp and mould**

Is your home damp?

Damp can cause mould on walls and furniture and make timber window frames rot. Damp housing encourages the growth of mould and mites, and can increase the risk of respiratory illness.

Some damp is caused by condensation. This leaflet explains how condensation forms and how you can keep it to a minimum, so reducing the risk of dampness and mould growth.

What is Condensation?

There is always some moisture in the air, even if you cannot see it. If the air gets colder, it cannot hold all the moisture and tiny drops of water appear. This is condensation. You notice it when you see your breath on a cold day, or when the mirror mists over when you have a bath.

Condensation occurs mainly during cold weather, whether it is raining or dry, it does not leave a 'tidemark'. It appears on cold surfaces and in places where there is little movement of air. Look for it in corners, on or near windows, in or behind wardrobes and cupboards. It forms on north-facing walls.

Is it Condensation?

Condensation is not the only cause of damp. It can also come from:

- Leaking pipes, wastes or overflows
- Rain seeping through the roof where a tile or slate is missing, spilling from a blocked gutter, penetrating around window frames, or leaking through a cracked pipe
- Rising damp due to a defective damp-course or because there is no damp course

These causes of damp often leave a 'tidemark'.

If your home is newly built it may be damp because the water used during its construction (for example, in plaster) is still drying out.

If your home is damp for any of these reasons, it may take weeks of heating and ventilation to dry out. Hiring a dehumidifier will help.

If you do not think the damp comes from any of these causes, then it is probably condensation.

damp and mould

How to avoid Condensation

Firstly, wipe down the windows and sills every morning. Then follow these three steps which will help you reduce the condensation in your home.

1 Produce less moisture

- Some ordinary daily activities produce a lot of moisture very quickly.
- Cover pans and do not leave kettles boiling.
- Avoid using paraffin and portable flueless bottled gas heaters as these heaters put a lot of moisture into the air.
- Dry washing outdoors on a line, or put it in the bathroom with the door closed and the window open or fan on.
- Vent any tumble dryer on the outside, unless it is the self-condensing type. DIY kits are available for this.

2 Ventilate to remove moisture

You can ventilate your home without making draughts.

- Keep a small window ajar or a trickle ventilator open when someone is in the room.
- Ventilate kitchens and bathrooms when in use by opening the windows wider. Or better still, use a humidistat-controlled electric fan. These come on automatically when the air becomes humid, and are cheap to run.
- Close the kitchen and bathroom doors when these rooms are in use, even if your kitchen or bathroom has an extractor fan. A door

closer is advisable, as this will help prevent moisture reaching other rooms, especially bedrooms, which are often colder and more likely to get condensation.

- Ventilate cupboards and wardrobes. Avoid putting too many things in them as this stops the air circulating. Cut a ventilation slot in the back of each shelf or use slatted shelves. Cut 'breather' holes in doors and in the back of the wardrobes and leave a space between the back of the wardrobe and the wall. Where possible, position wardrobes and furniture against internal walls.
- If you replace your window units at any time, make sure that the new frames incorporate trickle ventilators.

3 Insulate, draughtproof and heat your home

Insulating and draughtproofing will help keep your home warm and will also cut fuel bills. When the whole home is warmer, condensation is less likely.

- Insulate your loft. Remember to draughtproof the loft hatch but do not block the opening under the eaves.
- Consider cavity wall insulation. Before deciding though, you should talk to your local building inspector as building regulations approval is required.
- Consider secondary and double glazing of windows to reduce heat loss and draughts but you must ensure that there is some ventilation
- In cold weather, keep low background heating on all day, even when there is no one at home.
- Consider dry lining affected walls incorporating suitable insulation.

damp and mould

Some words of warning

- Do not block permanent ventilators
- Do not completely block chimneys. Instead, leave a hole about two bricks in size and fit a louvered grille over it
- Do not draughtproof rooms where there is condensation or mould
- Do not draughtproof a room where there is a cooker or a fuel burning heater, for example, a gas fire
- Do not draughtproof windows in the bathroom and kitchen

First steps against Mould

- First treat any mould you may already have in your home. If you then deal with the basic problems of condensation, mould should not reappear.
- To kill and remove mould, wipe down walls and window frames with a fungicidal wash which carries a Health and Safety Executive 'approval number'. Follow the manufacture's instructions precisely. Dry-clean mildewed clothes and shampoo carpets. Disturbing mould by brushing or vacuum cleaning can increase the risk of respiratory problems.
- After treatment, redecorate using a good quality fungicidal paint to help prevent the mould recurring. Note that this paint is not effective if overlaid with ordinary paints or wallpaper.

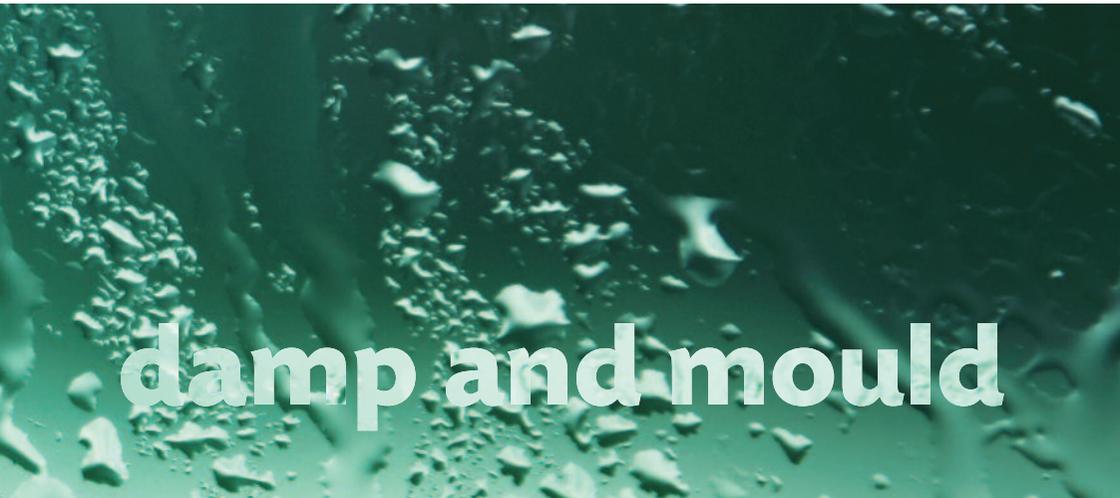

The only lasting way of avoiding severe mould is to eliminate dampness.

Useful Information

- If you are a homeowner or tenant you may be eligible for a Warm Front Scheme grant towards installing loft insulation or cavity wall insulation. The Warm Front Scheme is available to a wide range of people receiving various benefits, or who have a disability. For more information on the Warm Front Scheme visit their website www.warmfront.co.uk or call 0800 316 2805.
- More information about tackling condensation maybe available from your local Council.

Some of the information provided in this booklet has been obtained from other sources; however Hyltreat cannot be held responsible for the accuracy of any information collated when producing this guide. This document has been produced with a view to being a helpful guide for house owners, landlords and tenants on the causes and remedies of mould and condensation problems which can be encountered in domestic and commercial buildings. This is a service we provide in conjunction with our remedial damp proofing activities.
